Intentune

A development workspace to agree on what to build before AI writes code

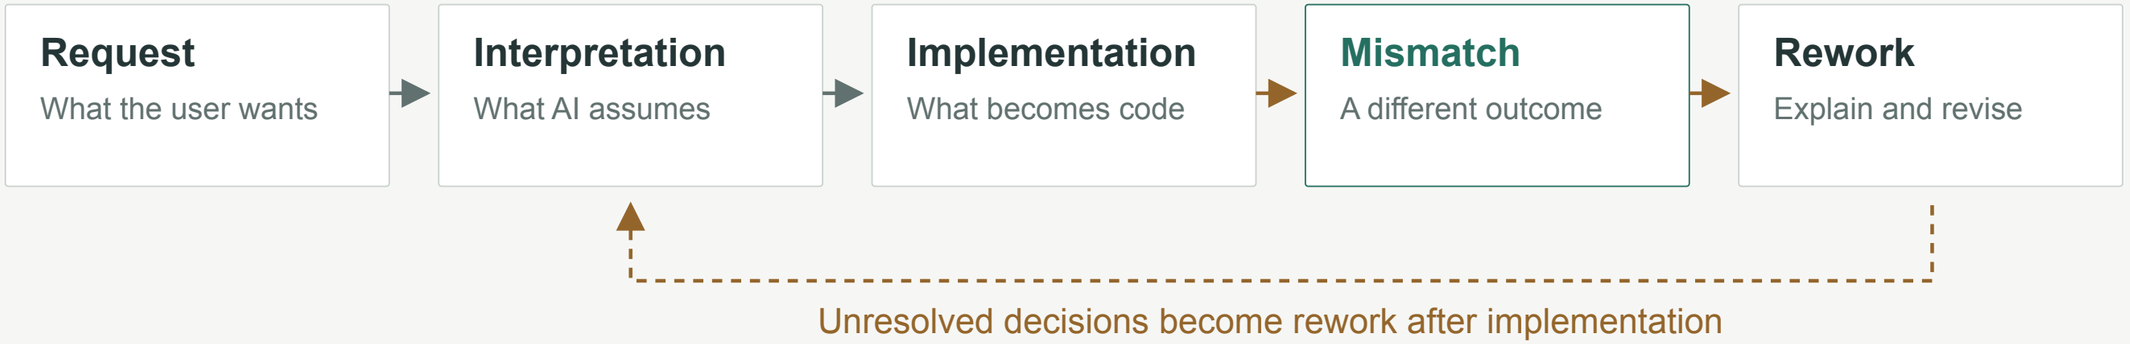

Clarify missing conditions through questions.
Carry those decisions into implementation and checks.

Multi Session · Example UI

Decide what matters before writing code

When a request leaves gaps, AI fills them with assumptions. Resolve the questions before implementation.

A request can be brief

“Improve the login flow.”

Keep the current auth? Replace it? Which error format?

The decisions need to be specific

Turn assumptions into questions.

Record decisions before execution.

Keep these decisions in questions and task specifications.

From request to result

A Workflow with an analysis step. Direct chat sends the request straight to the CLI.

01
Clarify intent

Intent
Natural-language request

→

Requirement
Find gaps and conflicts

→

Decision
User answers and decisions

02
Define the task

TaskSpec
Constraints and acceptance

→

Workflow
Steps, models and context

→

Implementation
Code changes per task

03
Verify the result

Verification
Local command results

→

Review
Requirements and diff

→

Completion
Record scope and results

Failure or decision needed → Repair / Attention → Resume affected steps

Chat and execution in one project

Switch between Tabs and Sessions, and return to pending decisions in Attention.

Direct / Workflow

Use Direct chat for quick exploration. Use an editable Workflow when the task needs explicit requirements and checks.

Tabs / Sessions

Focus on one task in Tabs or view conversations side by side in Sessions. Write Sessions use separate worktrees and branches.

Attention / Debate

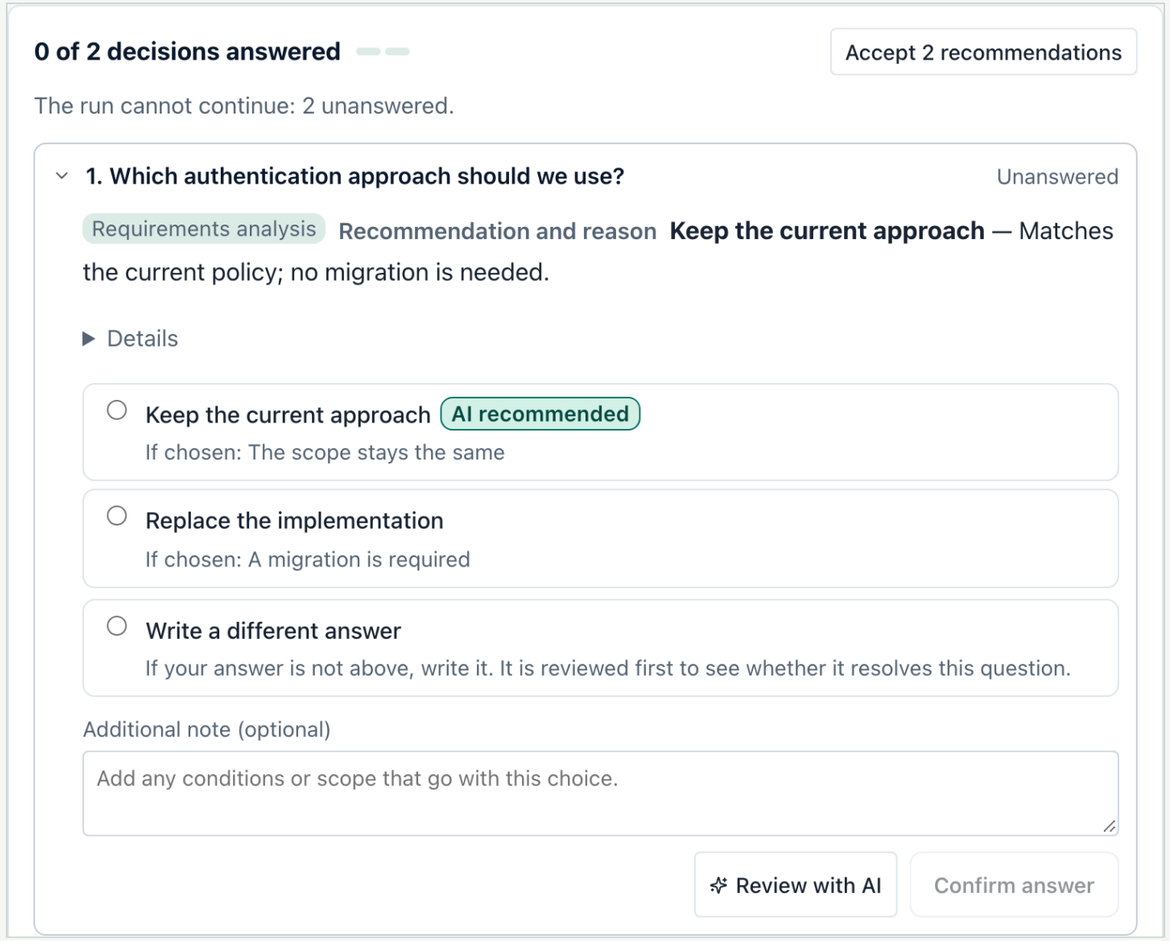

Gather items that need an answer. Discuss them with multiple AI agents and turn the conclusions into decisions or follow-up work.

Korean / English

Choose UI and AI response languages separately. Use the command palette and customizable shortcuts for frequent actions.

Separate requirements from assumptions

Distinguish user-confirmed requirements, explicit requests and AI inferences. Ask about unresolved conditions.

Requirement source

Keep user-confirmed requirements and explicit requests distinct from AI inferences and reference material.

Confirmed Decision

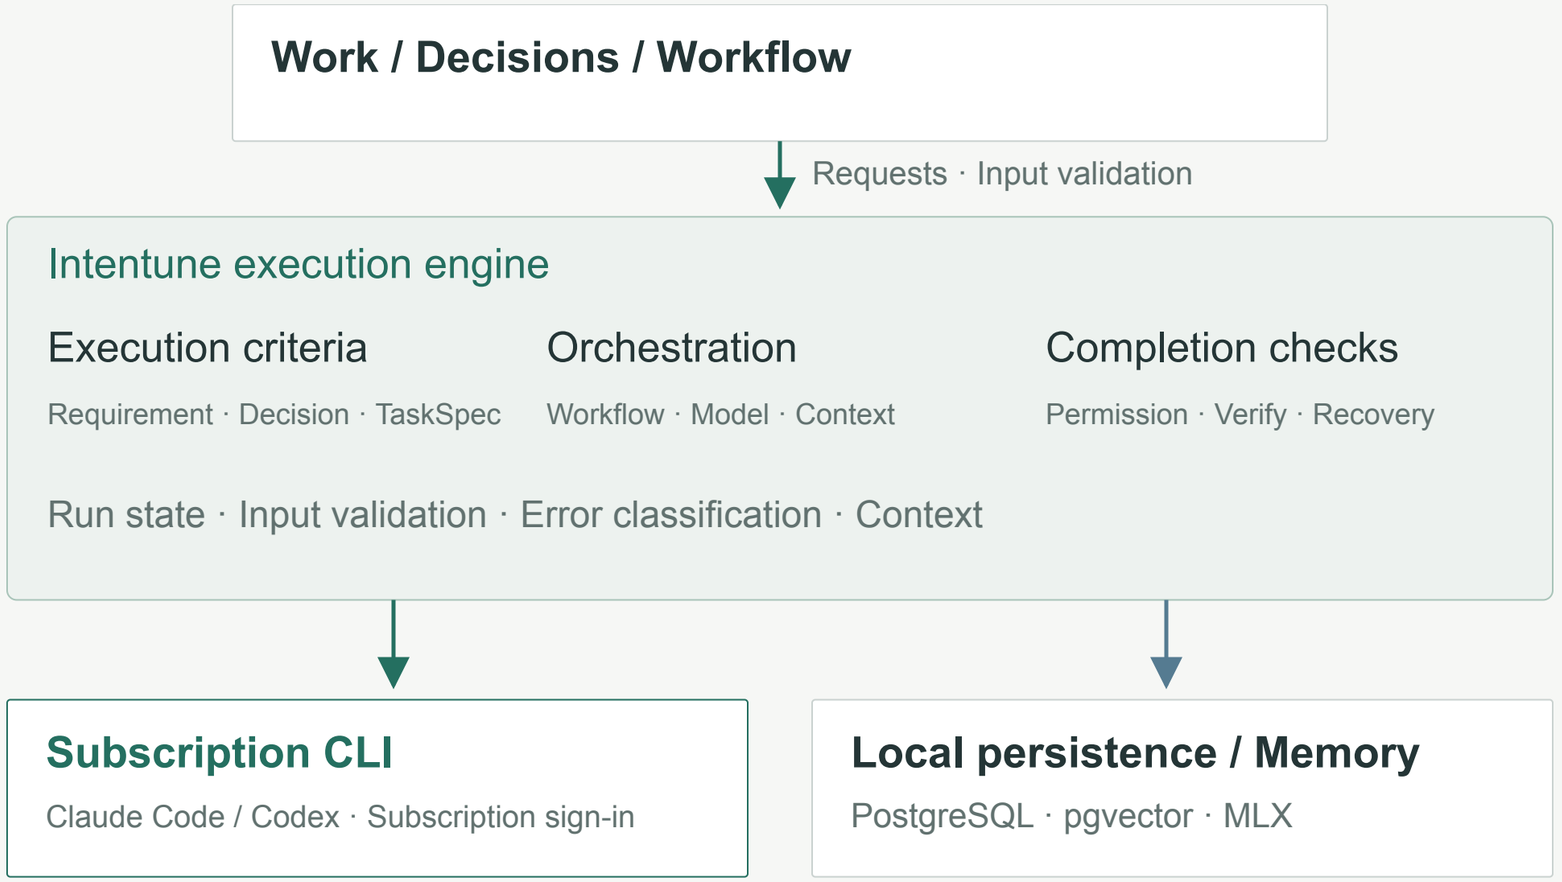

Choose a recommendation or write your own answer.
Revisit decisions and check for conflicts when needed.

Ask before continuing

Pause for an answer when judgment is needed. Supported questions can remember the choice for next time.

How execution is coordinated

Separate the interface, execution rules and CLI adapters to track readiness and completion.

Explicit context

Attach the TaskSpec, decisions, diff and Memory, and record what the run used.

Project permissions

Set policy first, then translate it for each CLI. Full access is an explicit project setting.

Consistent errors

Pass failures as structured codes and explain them in Korean or English in the interface.

Implement separately, merge in order

Record work as Run → Attempt → Step. Keep model, Skill and Context choices in execution settings.

Example Workflow · Normal execution path

Example independent tasks

Step dependencies

Plan → Implement → Verify → Review.
Enter Repair only when a failure calls for it.

Parallel tasks

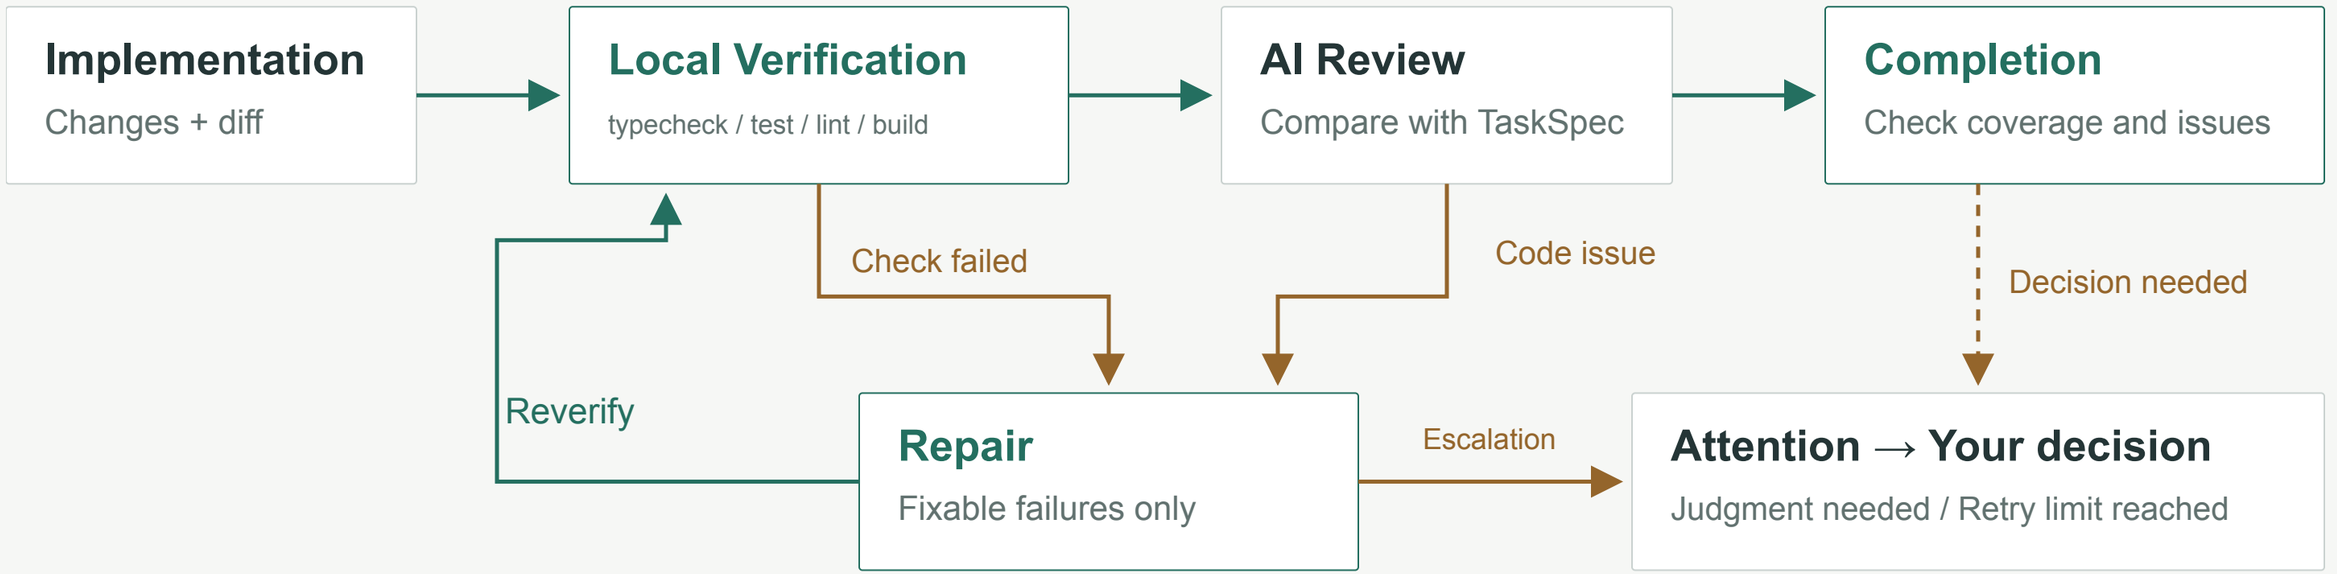

Independent tasks run in temporary worktrees and merge in dependency order. This is separate from parallel Workflow steps.

Session isolation

Write Sessions use separate worktrees. Check generated files and branch changes per repository, and copy only selected files.

Repair the failed step, then verify again

Local checks report command results. AI Review compares the changes with the requirements.

Baseline comparison

Compare failures with the pre-run baseline. Separate matching old failures from new ones; required failures still need a decision.

Bounded recovery

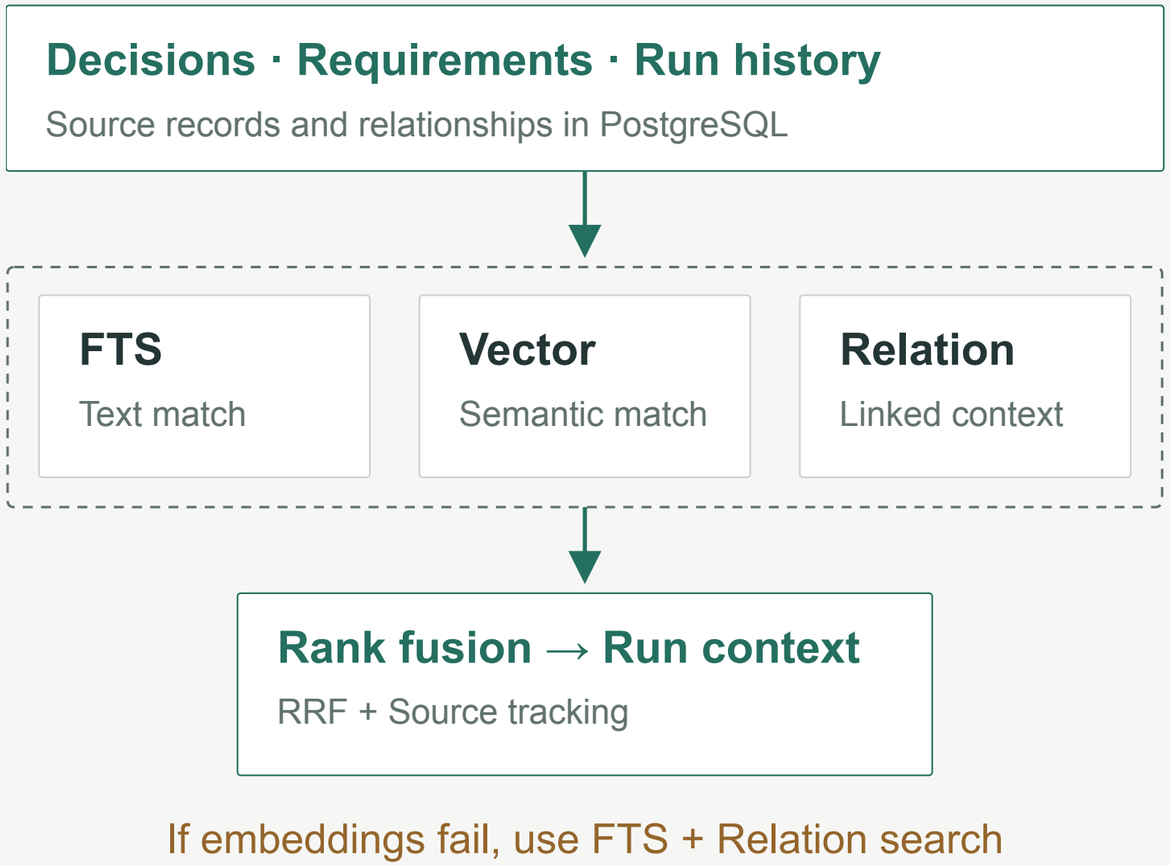

A resumed Repair continues through Verify and Review. Reuse valid earlier results and preview the recovery scope.

Completion status

Distinguish verified, partly unverified and unverified results. Completed analysis does not mean implementation is complete.

Use earlier decisions in the next task

Search requirements and run history together, then attach context relevant to the current work.

Find decisions beyond exact wording

Combine FTS, Vector and Relation results with RRF. Match words, meaning and connections between tasks.

Keep a record of the sources

Store the sources of attached decisions and records so the context used in a run can be reviewed.

Keep records independent of search

Separate source records from search indexes. If embeddings are unavailable, continue with FTS and Relation search.

Implementation choices by problem

Design decisions for clarifying requirements, recovering from failure, isolating work and reusing context.

Problem	Implementation	Effect on the workflow
Requirements change during execution	Questions, decisions, TaskSpec and execution gates	Make acceptance criteria explicit before coding
Restarting everything after a failure	Baseline comparison · Selective Repair · Reverification	Resume while keeping valid earlier results
Concurrent tasks edit the same files	Registered worktrees · Locks · Merge	Isolate tasks and apply changes in dependency order
Explaining the same context again	Linked decisions and requirements · Hybrid retrieval	Attach relevant decisions and run history to the next task

Local records, purpose-specific connections

Use your existing Claude Code or Codex subscription. No separate provider API key is registered in Intentune.

Run history and Memory

Run history and Project Memory are stored in a database on your Mac. Requests and code are passed to the Claude Code or Codex CLI used for the task.

External services

Updates use GitHub. Model downloads you request use Hugging Face. Git operations such as fetch, push and PRs connect to your project's remote.

Permissions per project

Apply policy through each CLI. Full access requires an explicit setting. Codex sandbox and Claude file-tool restrictions are not equivalent.

Updates and support

Open release notes, report a problem or ask a question from the app. Diagnostics mask paths and tokens, then copy to the clipboard for you to share.
